A: I want to tell you how my friend and i hacked ps2 slim i will add some important info's To play ps2 in ps2 slim we use a pair of stepper motors controlled by a neopixel strip. In his post, he connects the stepper motor to its corresponding neopixel strip. In his own words: "It takes some tweaking to get this to work smoothly and reliably, but the end result is a nice full color display (with the rather slow 255 - 0 - 255 - 255 display mode) of the emulated game. In order to fully use this monitor you will need a set of stepper motors with calibrated hall effect sensors. The motors are very cheap and I found a set of three for sale on eBay. You can just connect the hall sensors to the steppers and the nes chips will tell the motors when to move. Please note that since the emulated ps2 is connected to the nes chip via serial communication this means that you will only be able to use this hack when the nes chip is running. To find out if your console is running (aka: ready for hacking), you can plug it in and check if you see the game in the settings menu. When the game is running, you can then switch the monitor on and off by pressing the nes chip's power button for a few seconds. When you no longer see the game, stop pressing the power button. If you see the game again, switch it on and off again and again. If you still don't see the game, stop pressing the power button. If you still don't see the game, remove the battery and start all over again. I suggest using 4 stepper motors for the game screen and 2 for the second screen. If you have a stepper motor with calibrated hall effect sensors, you can connect both of these to the second screen so you can switch between the two screens with ease. If not, you can just connect the sensors to the second screen as well. I did this by connecting the nes chip's USB (not serial!) port to the second screen. The command to move the third screen is (surprisingly) quite simple, assuming that the nes chip is running. For example, in a Nesteroid scene, when the game asks for a position, you send it the following: 00000100 This will move the third screen to the right. The number after the first "0 82157476af
